

REFLECTIONS

This week I focused on completing the Python course on Codio and reading about algorithms.

I also completed as many Python exercises as possible to become familiar with creating and manipulating data. This is the area to which I intend to devote my next step career.

This week was challenging, but I completed most of the Labs and Challenges in Codio's Python Course. Before this MSc, I took some Python courses, and these challenges helped me revise my previous knowledge and deal with all exercises of Python tasks from Codio.

The Python course on Codio introduced me to a new level and excited me to learn more and experiment as much as possible.

Even though I am familiar with some Python processes, I need to practise even more to get started on the right foot. I completed the Labs and Challenges at the end of each module, but I believe I could have done better to achieve better results.

At the end of Unit 9, I conducted extensive research and reading on algorithms which I have documented in this ePortfolio.
