Unit 11 – Reflection:

The unit study for this week was quite challenging as it required us to collaborate and develop a team project involving coding. Fortunately, we had a very efficient and decisive team, with one of our members, Sebastian, an expert in this field, who took the lead and designed and explained to us the functionalities of the project. The rest of us contributed by providing comments on the code and writing the readme document for submission as part of the assignment.

As part of our studies this week, we also had a team activity which involved a debate about microservices and microkernels. I conducted thorough research on the topic and submitted my thoughts, which I will add to my ePortfolio. It was a great experience as I was able to learn more about these concepts and also improve my research and critical analysis skills.

This week was both challenging and rewarding for me. Although I was pretty stressed due to my lack of coding expertise, my team was very supportive and collaborative, which made me feel more comfortable. As a result, I began to grasp the concept better. This experience will undoubtedly help me progress in this field, and the knowledge I gain will help me deal with stressful situations.
